EDUCATION

Bachelor of Science in Computer Science | Major GPA: 3.55/4.00
Colorado School of Mines

2026

Master of Science in Computer Science
Colorado School of Mines

2026-Present
Golden, CO

WORK EXPERIENCE

Data Integration Intern
Trellis Health

Jun 2026 – Aug 2026
Portland, ME

- Owned build-vs-configure evaluation of a HIPAA-compliant integration platform across 5 use cases spanning EHR, CRM and patient messaging systems, translated requirements to a capability matrix and recommendations that shaped the scope of work assigned to an external development partner.
- Gathered requirements from physician, pharmacist, and operations stakeholders to clarify clinical use cases and translate clinician needs into technical recommendations.
- Diagnosed the dependency blocking most use cases to a lack of a shared patient identifier across systems and no persistent state infrastructure in the automation layer, and recommended a crosswalk table schema design mapping each system's patient ID.
- Evaluated EHR API and webhook coverage, identifying missing change events and inaccessible clinical data that blocked a priority use case; escalated findings directly to the vendor, initiating the remediation process.

PROJECTS

API Change Detection Platform | Angular 17, Java Spring Boot, PostgreSQL, Docker

- Collaborated in a three-person team to develop a full-stack platform that logged changes in third-party APIs, reducing the risk of breaking integrations by maintaining version history.
- Implemented backend with Spring Boot and PostgreSQL to store and serve historical API data with efficient version tracking.
- Built responsive Angular 17 frontend to visualize API updates and provide users with searchable access to prior versions.
- Engineered modular architecture separating fetch logic, storage, and frontend presentation, improving maintainability and scalability.

Geospatial Wildlife Sightings Platform | Angular 17, Java Spring Boot, PostgreSQL, Python

- Turned raw GPS coordinates of animal sightings into a searchable site using GeoPandas spatial joins against ArcGIS boundary layers, making 200,000+ unstructured observations queryable and location-aware
- Designed ETL pipelines ingesting and normalizing wildlife, park, and trail datasets from multiple sources into a PostgreSQL schema optimized for spatial filtering and pagination.
- Built a full-stack Angular and Spring Boot interface enabling users explore sightings by species, park or trail and contribute their observations.

Healthcare Data Pipeline | Python - Analytical Infrastructure Project for Recon Strategy

- Built an automated large-scale ingestion pipeline that aggregates oncologist profiles and research activity from PubMed and other external APIs, producing a clean dataset ready for downstream analysis.
- Designed a validation and standardization layer to ensure data consistency and integrity across heterogeneous inputs.
- Scaled Python workflows to collect, normalize and persist structured data for 200,000+ entities.

TECHNICAL SKILLS

Languages | C++, Python, TypeScript, HTML/CSS, Common Lisp

Frameworks | Angular 17, Spring Boot

Developer Tools | Git, Docker, Visual Studio Code, Linux, Wireshark, PostgreSQL
